National Institute of Technology Meghalaya

Assignment No: 06

Student Name: Subhasish Dutta

Roll Number: T23CS001

Programme: Master of Technology

Department: Computer Science & Engineering

Semester: 01

Course Name: ADVANCED DBMS LAB

Course Code: CS553

```
import pymongo

client=pymongo.MongoClient("mongodb+srv://subhasishduttashuvo2018:shuvo634@cluster0.uwil4if.mongodb.net/?retryWrites=true&w=majority")

# Question No : -01
# 1. Design a MongoDB schema for a "Student" collection with the following fields:
# a. RollNum
# b. FirstName
# c. LastName
# d. Age
# e. Department
# f. Mark

db = client.student  # Replace 'school' with your database name

# Define the schema for the "Student" collection
student_schema = {
    "RollNum": int,
    "FirstName": str,
    "LastName": str,
    "Age": int,
    "Department": str,
    "Mark": int
}

# Create the "Student" collection with the defined schema
student_collection = db.Student

# Inserting one document with the specified schema to ensure collection creation
student_collection.insert_one({
    "RollNum": 0,
    "FirstName": "Sample",
    "LastName": "Student",
    "Age": 0,
    "Department": "Sample",
    "Mark": 0
})

# Drop the sample document (optional)
student_collection.delete_one({"RollNum": 0})

# Now the "Student" collection is created with the specified schema
print("Schema for 'Student' collection created.")

     Schema for 'Student' collection created.

# Question no : 02

# 2. Insert the following student data in the collection.
# RollNum FirstName LastName Age Department Mark
# 43 John Doe 20 Computer Science 78
# 67 Alice Smith 22 Physics 59
# 23 Bob Johnson 21 Computer Science 81
# 18 Eve Adams 19 Mathematics 56
# 84 Mike Brown 23 Physics 92

student_schema = {
    "RollNum": int,
    "FirstName": str,
    "LastName": str,
    "Age": int,
    "Department": str,
    "Mark": int
}

# Question no : 03
# 3. Write a MongoDB query to find all students.
student_data = [
    { "RollNum": 43, "FirstName": "John", "LastName": "Doe", "Age": 20, "Department": "Computer Science", "Mark": 78 },
    { "RollNum": 67, "FirstName": "Alice", "LastName": "Smith", "Age": 22, "Department": "Physics", "Mark": 59 },
    { "RollNum": 23, "FirstName": "Bob", "LastName": "Johnson", "Age": 21, "Department": "Computer Science", "Mark": 81 },
    { "RollNum": 18, "FirstName": "Eve", "LastName": "Adams", "Age": 19, "Department": "Mathematics", "Mark": 56 },
    { "RollNum": 84, "FirstName": "Mike", "LastName": "Brown", "Age": 23, "Department": "Physics", "Mark": 92 }
]
```

```
student_collection = db.Student

# Insert data into the "Student" collection
result = student_collection.insert_many(student_data)
print(f"{len(result.inserted_ids)} documents inserted")
```

```
5 documents inserted
```

```
# Question no : 03
# 3. Write a MongoDB query to find all students.
#printing the result

output=db.Student.find({});
for student in output:
    print(student)
```

```
{'_id': ObjectId('6550ac8810f8b8cf38c8a008'), 'RollNum': 43, 'FirstName': 'John', 'LastName': 'Doe', 'Age': 20, 'Department': 'Compu
